

DBB2 Frequently Asked Questions

Why don't you just trade on your own models?

We could trade on our models. We could also license basketball intelligence to 100 platforms. The second path scales infinitely better. Our business is providing explainable player intelligence to organizations that want to build better products for their users. Trading limits us to one book. Licensing lets us work with many partners.

How is DBB2 different from traditional projections?

Traditional projections generate single predictions. DBB2 provides explainable intelligence: full probability distributions from Monte Carlo simulations, historical player comparables from 30+ years of NBA data, player archetype classifications, and transparent confidence scores. We show you why, not just what. No black-box models.

How accurate is DBB2?

Accuracy varies by use case. For historical comparables, accuracy is high (we're matching actual historical data). For projections, accuracy depends on context and player circumstances. We don't promise to beat the market. We provide explainable intelligence that improves decision-making. Pilot evaluation will show accuracy in your specific use cases.

Can I use my own models alongside DBB2?

Absolutely. DBB2 is designed to complement existing systems, not replace them. Most customers run DBB2 alongside their current models during evaluation. You can cherry-pick which intelligence products matter to you. Some use Historical Comparables only. Others use the full suite.

How long does integration take?

Sandbox testing: 1-2 weeks. Staging integration: 2-3 weeks. Integration complexity depends on your architecture. REST API integration is faster. Batch data pipelines require more setup. We work with your team to minimize disruption. Typical enterprise integration: 4-6 weeks total.

Which sports does DBB2 support?

Currently: NBA (basketball). Our 54-player archetype system and 30+ years of historical data are basketball-specific. We're exploring other sports (NFL, MLB) but focus today is NBA. If you need other sports, let's discuss your timeline and priorities.

How often is DBB2 data updated?

Player archetypes: Quarterly updates as the season progresses. Injury status: Hourly syncs from official NBA sources. Historical comparables: Static baseline (we compare against 30+ years of history). Projections: Real-time or daily depending on your integration model. Confidence scores: Decay gradually as season progresses without new data.

Does DBB2 replace my existing models?

No. DBB2 is a data layer, not a replacement. It provides intelligence that enriches existing models. Many customers run DBB2 alongside their current system for validation and comparative analysis. The goal is better decision-making through access to more information, not replacing your team's expertise.

What's the support model during pilots?

Phase 1: Email/Slack support, with technical POC availability. Phase 2: Dedicated Slack channel, weekly check-ins, and rapid response to issues. Phase 3: SLA-backed support (99.5% uptime guarantee) with escalation paths.

What happens if we don't move to production after the pilot?

No problem. Sandbox and staging access end at the conclusion of Phase 2. You're under no obligation to move to production. Pilot is designed to validate fit before any financial commitment. Many organizations pilot and decide to revisit later—we keep the door open.
