

DBB2 for Prediction Markets

Built for prediction market operators, market makers, and quantitative trading teams.

Explainable Player Intelligence for Basketball Markets

The Challenge

Prediction market operators need better inputs for pricing, monitoring, and explaining basketball markets. Without explainable reasoning, traders question confidence levels and platforms struggle to justify market depth.

Our Approach

DBB2 generates explainable player performance probability distributions backed by 30+ years of historical data, 54 player archetypes, and transparent modeling. Every output is auditable and defensible.

Core Capabilities

Historical Player Comparisons: This archetype matched 47 historical players. Their outcomes: [distribution].

Explainable Confidence Scoring: Every projection includes confidence intervals and reasoning. Traders understand why, not just what.

Monte Carlo Simulations: 10k simulations per player generate full probability distributions for use in pricing and risk models.

Transparent Methodology: Participants can audit the model. No black-box magic.

Integration

REST API with real-time player updates

JSON responses designed for pricing engines and research workflows

Sandbox environment for testing before production

Potential Value

Improve market pricing for player props and game outcomes with explainable inputs

Accelerate research on newly created markets with historical context

Provide explainability alongside pricing decisions for trader confidence

Generate historical context for traders and market analysts

Differentiate your platform with transparent basketball intelligence

Next Steps

Phase 1 (2 weeks): Integration sandbox. API access. Sample data for 50 players across 100 games.

Phase 2 (2 weeks): Evaluate pricing quality, workflow integration, and model performance against existing approaches.

Phase 3 (ongoing): Production deployment. Revenue share or flat licensing.
