

StockArithm

Explainable Market Intelligence for Professional Investors

The Challenge

Financial professionals are overwhelmed with market data but lack transparent tools that explain *why* a company, sector, or market condition resembles historical opportunities.

Most AI tools generate recommendations without exposing the reasoning behind them, making it difficult to trust, validate, or integrate those insights into professional investment workflows.

Our Approach

StockArithm combines historical market analysis, explainable AI, and structured financial intelligence to help investors identify, understand, and validate market opportunities.

Rather than producing black-box recommendations, every insight is backed by historical analogs, measurable factors, and transparent reasoning.

Core Capabilities

Historical Market Comparisons: Identify historical companies and market environments that most closely resemble current opportunities.

Explainable Analysis: Every insight includes supporting evidence rather than a simple prediction.

Sector Intelligence: Evaluate companies within the context of their peers, industries, and historical cycles.

Alternative Data Integration: Combine structured market data with additional signals to enhance research.

Enterprise APIs: Deliver explainable market intelligence directly into existing research and investment workflows.

Potential Value

Accelerate investment research with structured historical context

Improve analyst productivity by surfacing relevant historical analogs automatically

Generate differentiated content for financial media and research platforms

Support AI-powered investing platforms with explainable intelligence

Deliver transparency to professional investors who demand understanding, not just recommendations

Who Benefits

Investment firms • Asset managers • Financial media • Research providers • Alternative data companies • AI investment platforms

Engagement Model

Phase 1 (2-3 weeks): Research sandbox with selected securities and historical market analysis.

Phase 2 (2-3 weeks): Evaluate workflow integration alongside existing research and investment processes.

Phase 3 (ongoing): Enterprise API integration and production deployment.
