Beyond DBB2: Building Explainable Intelligence Layers

R and B AlgoLabs builds specialized intelligence platforms for domains where transparency and historical context drive better decisions. DBB2 is our first platform. Our roadmap extends into adjacent areas where the same principles apply: explainability, historical validation, and enterprise-grade reliability.

Current Product

DBB2 — Basketball Intelligence Platform

Status: Production (Live)

54 player archetypes, 30+ years of historical data, Monte Carlo simulations, explainable projections. Available via REST API. Deployed with NBA teams, sportsbooks, prediction markets, media, and analytics platforms.

In Development

Prediction Market Intelligence (Project: Forkcast)

Status: Active Development

A specialized intelligence layer for prediction market operators. Forkcast focuses on cross-platform market analysis and canonical event matching.

Core Capabilities:

- Cross-platform market matching — Identify equivalent markets across prediction exchanges
- Canonical event identification — Standardize market definitions for comparison
- Equivalent market detection — Surface duplicate or nearly-identical markets
- Cross-market divergence analysis — Identify pricing anomalies and arbitrage opportunities
- Confidence scoring — Measure market relationship strength and equivalence certainty
- Market relationship analytics — Understand how market categories relate to each other

Potential Applications:

- Cross-exchange monitoring for market surveillance
- Arbitrage research and opportunity identification
- Market integrity monitoring and anomaly detection
- Trading analytics and execution optimization
- Internal research tooling for quantitative teams

Our Philosophy

We don't build products that replace human judgment. We build intelligence layers that support better decisions through transparency and historical validation. Every product follows this principle:

Explainable: Every insight includes reasoning, not just recommendations.

Auditable: Users can trace decisions back to historical data and methodology.

Enterprise-grade: Designed for institutional workflows, not consumer apps.

Complementary: Enriches existing infrastructure, doesn't require replacing current systems.
